

Trumatch color palette

for producing accurate spot colors in digital prints

- 1) Place this EPS file into the application that will be used to output the final pieces.
- 2) Print using the same laser or inkjet printer that will be used for the final outputs.
- 3) Pick the color you want from the physical palette you just printed (hue first, then value).
- 4) In your application, pick the Trumatch color you just selected from the palette, ignoring how it looks on screen.
- 5) Print using the same color printer and get the color you want in the final output.

Print another palette and choose again if you switch to a different computer, application or output device.
